Glomerulonephritis

Glomerulonephritis (GN) is an inflammatory disease of the glomeruli (filtering unit) of the kidney. It is characterized by pathologic changes in the glomeruli and smaller blood vessels of the kidney. Glomerular damage causes leaking of protein, blood, and white cells into the urine. Causes of GN include diabetes mellitus, cancer, drugs, infections, hypertension, or abnormal antibody response (immunologic).

Primary or secondary GN is subdivided into 5 major syndromes based on the clinical course:

- 2. **Rapidly progressive glomerulonephritis** (RPGN) has an acute onset and rapid progression. Examples include lupus erythematosus and Goodpasture's disease (GN and lung disease). Prognosis is poor.
- 3. **Nephrotic syndrome** is GN with heavy proteinuria defined as over 3.5 grams of protein a day. Examples include membranous GN and minimal change disease. Of this group, minimal change disease has a better prognosis.
- 4. **Primary hematuria/proteinuria syndrome** is persistent, asymptomatic minimal hematuria (RBC's in urine) and proteinuria (protein in urine), for example IgA nephropathy.
- 5. **Chronic glomerulonephritis** (chronic GN) is slowly progressive GN due to any cause of GN such as membranoproliferative GN. Chronic GN leads to chronic renal failure.

As noted above, most with acute GN recover completely. Chronic progressive GN may have a slow course to kidney failure. Kidney failure results in death. Treatment with dialysis can postpone mortality by several years. Kidney transplantation has a better prognosis if there is no rejection of the transplanted kidney.

Underwriting Consideration absent any other significant disease:

Acute Glomerulonephritis:		
single attack with full recovery	1st year	\$5x2
	2nd year	\$5x1
	thereafter	non-rated
With persistent hematuria only (over 30 red blood cells)		Table B
persistent proteinuria, hypertension or impaired renal function		Decline
Minimal change disease:		
confirmed by biopsy, full recovery	1st year	Table D
	2nd year	Table C
	3rd year	Table B
	thereafter	non-rated

Other types of GN are rated depending on the pathological (biopsy) diagnosis and the current urinalysis, kidney function tests (BUN and creatinine) and blood pressure. The range is Table E to Decline.

For example:

Acute Glomerulonephritis:	Diagnosis	Rating
current normal urine, BUN and creatinine, BP under 130/85, urine	IgA nephropathy	Table E
protein/creatinine ratio under 0.3	membranoproliferative GN	Table H
current normal creatinine and BUN BP under 150/90, urine	IgA nephropathy	Table H
protein/creatinine ratio under 1.5	membranoproliferative GN	Table H
If BUN and creatinine are elevated, BP poorly controlled or urine protein/creatinine ratio is over 1.5	any glomerulonephritis	Usually Declined

To get an idea of how a client with *Glomerulonephritis* would be viewed in the underwriting process, feel free to use the *Ask "Rx" pert underwriter* on the next page for an informal quote.

Glomerulonephritis - Ask "Rx" pert underwriter (ask our experts)

Producer	Phone	Fax
Client	Age/DOB	Sex
If your client has a history of Glomerulonephritis, I	please answer the following:	
Please note type of Glomerulonephritis:		
2. Please list date of first diagnosis:		
3. Was a kidney biopsy done?		
yes, please give date and diagnosis		
□ no		
4. Is your client on any medications?		
☐ yes, please give most recent test result	ts.	
□ no		
5. Please provide the client's most recent readings	s for:	
☐ Blood Pressure		
☐ BUN		
☐ Creatinine		
☐ Urinalysis		
6. Has your client smoked cigarettes in the last 12		
□ yes, please give details		
no		
7. Does your client have any other major health pr	oblems (ex: diabetes, lupus, e	tc.)?
yes, please give details	•	
□ no		
After reading the Rx for Sucess on <i>Glomerulone</i> , informal quote.	phritis, please feel free to use	e this Ask "Rx" pert underwriter for ar
